Built Athletics - Development Session Summary

Date: March 30-31, 2026
Project: AI-Powered Fitness & Nutrition App
Repository: `https://github.com/Gymiles-Rewards/ImageUploadAPI.git`

1. What Was Completed This Session

AWS RDS PostgreSQL Setup

- Created RDS instance `built-athletics-db` (db.t3.micro, Free Tier) running PostgreSQL 16.6 in us-east-2
- Created security group `sg-02cce2a35c8ab98ed` with port 5432 open
- Updated `.env` and `prisma/schema.prisma` with RDS connection string
- Ran Prisma migration (`20260331222926_init`) — all 15 tables created
- Seeded admin user: `admin@builtathletics.com` / `Admin123!`

AWS Elastic Beanstalk API Deployment

- Installed AWS CLI and EB CLI
- Created IAM roles: `aws-elasticbeanstalk-ec2-role` (instance profile) and `aws-elasticbeanstalk-service-role`
- Created deployment config: `Procfile` , `.ebextensions/nodecommand.config` , `.ebignore`
- Added `engines` field to `package.json`
- Created EB application `built-athletics-api` and environment `built-athletics-prod`
- Deployed v1 (initial) and v2 (with food diary endpoint)
- Upgraded instance from t3.micro to **t3.small** (2 GB RAM) after npm install timeouts
- All environment variables configured (DATABASE_URL, AWS keys, JWT_SECRET, OPENAI_API_KEY, S3 buckets)

Vercel Admin Dashboard Deployment

- Deployed admin dashboard to Vercel with proxy rewrites to EB backend
- Configured `vercel.json` with rewrites: `/api/*` proxied to EB (avoids HTTPS mixed-content)

- Set `VITE_API_URL` environment variable on Vercel
- Fixed trailing newline in config.js build script

Mobile App Screens Wired to API

- **GymDiaryScreen** — Fetches today's workouts via `POST /ba/getWorkout` on screen focus
- **FoodDiaryScreen** — Fetches diary entries via new `GET /user/food-diary` endpoint on focus
- **ProfileScreen** — Fetches full user profile via `GET /user` and today's nutrition on focus
- Added new backend endpoint: `GET /user/food-diary` (food.controller.ts + food.routes.ts)
- Added `getFoodDiary()` to mobile API client (food.ts + endpoints.ts)

Git

- Committed 33 files, 3,445 lines added
- Pushed to `origin/main`

---

2. Live Deployments

Service	URL	Status
API (Elastic Beanstalk)	http://built-athletics-prod.eba-3smbck5h.us-east-2.elasticbeanstalk.com	Green
Admin Dashboard (Vercel)	https://admin-dashboard-lime-seven-35.vercel.app	Live
Admin Login	`admin@builtathletics.com` / `Admin123!`	

---

3. AWS Infrastructure

Resource	Details	Region
S3 Buckets	`built-athletics-uploads`, `built-athletics-processed`	us-east-2
RDS PostgreSQL	`built-athletics-db` — db.t3.micro, PostgreSQL 16.6, Free Tier	us-east-2

Elastic Beanstalk	`built-athletics-prod` — t3.small, Node.js 20, SingleInstance	us-east-2
Security Group	`sg-02cce2a35c8ab98ed` — port 5432 open	us-east-2
IAM User	`built-athletics-api` — AdministratorAccess + S3/RDS/EC2	Global
IAM Roles	`aws-elasticbeanstalk-ec2-role`, `aws-elasticbeanstalk-service-role`	Global

---

4. Complete Project Architecture

Mobile App (React Native / Expo)

- Expo SDK 54, TypeScript, React Navigation v7
- Zustand state management, @tanstack/react-query
- 49 screens with full UI (auth, onboarding, food, exercise, meal plans, rewards, profile)
- AI image recognition (food, receipt, body analysis)

Unified Backend (Node.js / Express / TypeScript / Prisma)

- 15 Prisma models: User, Category, Exercise, CustomExercise, Workout, Food, FoodDiaryEntry, MealPlan, UserMealPlan, ShoppingItem, HealthRecord, Product, ProductReview, Order, OrderItem, Upload, ProcessingResult
- Controllers: auth, user, exercise, food, meal plan (BA), health data, product, admin
- AI: OpenAI Vision (GPT-4o) for food/receipt/body analysis, meal plan generation
- JWT auth, bcrypt, S3 uploads (multer-s3), rate limiting, Helmet, CORS

Admin Dashboard

- Pure HTML/CSS/JS single-page app with dark theme
- Dashboard stats, Categories CRUD, Exercises CRUD (image/video upload), Foods, Products, Users
- Embedded at `/admin` for local dev, standalone on Vercel for production

---

5. Database Schema (15 Models)

Model	Purpose
User	Authentication, profile, fitness goals, gymiles
Category	Exercise categories (Chest, Back, Legs, etc.)
Exercise	Exercise library with images/videos
CustomExercise	User-created exercises
Workout	Logged workouts with sets (reps/weight)
Food	Food database (name, macros, barcode)
FoodDiaryEntry	Daily food log by meal type
MealPlan	AI-generated meal plans
UserMealPlan	User's saved meal plans
ShoppingItem	Shopping list from meal plans
HealthRecord	Steps, heart rate, calories, distance
Product	Rewards marketplace products
ProductReview	Product reviews/ratings
Order / OrderItem	Product orders
Upload / ProcessingResult	AI image processing pipeline

---

6. Files Modified This Session

File	Change
`.env`	DATABASE_URL updated to AWS RDS
`prisma/schema.prisma`	Removed directUrl (not needed for RDS)
`package.json`	Added engines field for EB

`Procfile`	New — EB startup command
`.ebextensions/nodecommand.config`	New — EB Node.js config
`.ebignore`	New — EB deploy exclusions
`admin-dashboard/vercel.json`	Added API proxy rewrites
`admin-dashboard/build.js`	Fixed trailing newline, set empty API_URL for proxy
`src/controllers/food.controller.ts`	Added getFoodDiary endpoint
`src/routes/food.routes.ts`	Added GET /user/food-diary route
`Mobile: GymDiaryScreen.tsx`	Wired to fetch workouts from API
`Mobile: FoodDiaryScreen.tsx`	Wired to fetch diary entries from API
`Mobile: ProfileScreen.tsx`	Wired to fetch user profile from API
`Mobile: api/food.ts`	Added getFoodDiary() function
`Mobile: api/endpoints.ts`	Added foodDiary.get endpoint

---

7. What's Next

High Priority

#	Task	Status
1	Populate exercise library via admin dashboard (categories + exercises with images/videos)	Pending
2	Update mobile app `EXPO_PUBLIC_API_URL` to point to live EB URL	Pending
3	Test on real device (iOS/Android) — login, food diary, exercise logging, meal plans	Pending
4	Add HTTPS to API (ACM certificate + Load Balancer or CloudFront)	Pending

Medium Priority

#	Task

5	Custom domain — `api.builtathletics.com` (EB), `admin.builtathletics.com` (Vercel)
6	Edamam API keys for barcode/nutrition lookups
7	Push notifications (FCM/APNs)
8	Payment integration (Stripe) for rewards checkout
9	Seed food database (USDA or similar)

Before App Store Launch

#	Task
10	App icons & splash screen
11	EAS Build setup for iOS/Android production builds
12	App Store / Play Store listings
13	Production JWT secret (replace dev secret)
14	Security hardening (RDS security group, rate limits, input sanitization)
15	Monitoring (CloudWatch alarms, error alerts)

---

8. Credentials Reference

Service	Detail
Admin Dashboard	`admin@builtathletics.com` / `Admin123!`
RDS Endpoint	`built-athletics-db.c7824c4imxc8.us-east-2.rds.amazonaws.com:5432`
RDS Database	`builtathletics` / user: `postgres`
EB Environment	`built-athletics-prod` (t3.small, Node.js 20)
IAM User	`built-athletics-api`

Generated March 31, 2026 — Built Athletics Development Session
